At the same time the German retreat threatens to become a rout with a great German force southwest of the Ardne salient menaced with annihilation or capture.

The defeat inflicted upon the Germans since the Franco-American drive began on July 18 is the most crushing reverse the invaders have suffered since the battle of the Marne four years ago.

Not only did the allies take Soissons in a storm attack, but they continued their progress three miles eastward along the Aisne river, closing the German line of retreat.

At the same time the French advanced between the Ardne and Vesle rivers fighting lighter the dimming "V-neck" through which the Germans must retire in the Fiamme sector.

There is every indication that the Germans will be unable to make a stand north of the Vesle and that they will be compelled to fall back to the high ground north of the Aisne, where they stood early in May.

As they fell back north of the Vesle the Germans are laying the country in waste. Great conflagrations can be observed and for miles the sky is clouded by day with the smoke of burning villages.

The advance upon the Vesle now continues from three directions and it is believed that the town will fall quickly.

At last reports the French captured the Vesle river, and the Germans are being driven back to the Vesle river.

Reasons For Sugar Restriction And Its Plan of Distribution

Why the national sugar administration has made the restrictions on the consumption of sugar and its explanation of the reasons for its plan of distribution are contained in the following bulletin just issued by the food administration office:

"The first of the new sugar crop, which is estimated to reach the market in October in the form of beet sugar. This harvest will continue the remainder of the year. Louisiana cane will begin to come in about the middle of November, and Cuban cane about the middle of December, although perhaps not in large quantities until January.

"Before the war the allied nations drew virtually no sugar from the sources of American supply. Now about one-third of the sugar from these sources is going to the allies.

"The first draft on the sugar lands naturally comes from the trenches and the fighting lines. Not only the American troops in the field, but those of the allied nations as well must be maintained to the fullest. These requirements are very difficult to supply on any level of normal consumption. Sugar is a fuel for the body. From it can be obtained the quickest reaction in heat and energy. Therefore when the weather is severe in the trenches the consumption of sugar by the troops necessarily becomes excessive. Sugar has the effect of what the immediate stimulative effect of alcohol, without the injurious consequences.

"Supplies of rations being manufactured for the troops will be maintained to its fullest extent. The 3^d M. C. A. of France, Knights of Columbian and Salvation Army units in France will be fully provided with sweets. It is only fair that the people at home should conserve for the men in the field.

"The people of America, it is declared, have had but little opportunity to get on a high and alkali alkalis with those of the allied nations. But sugar is one article which they can get nowhere near a fair level. Even if they are able to maintain the allies at their maximum and still keep the home population to two pounds, the balance will be in their favor because of the more rigid limitations placed on manufacturing abroad.

"The home ration of two pounds per month per person is more than absolutely necessary from a dietetic standpoint, excepting for people who are facing great demands upon their energy, such as constantly getting wet or enduring, nor is it a vicious or performing feat of prodigious endurance.

"The people of the United States in wheat raising have since what a democracy do. For the past several months the household consumption of wheat has been less than 50 or 60 per cent of normal, while in the immediate past the whole country has been content to do with only about 35 or 40 per cent of normal wheat requirements. The result has been that they were able to export 142,000,000 bushels of wheat, much of it as flour, that harvest, would not have been able to send overseas. This wheat was the salvation of the allies, and each individual who helped to attain this result may have in some degree the same consciousness of duty that we have the soldier in the trenches.

"What has been done with wheat and sugar. It is up to the individual American.

"That the present household sugar ration of two pounds per month per person is about half of the consumption for similar purposes during the first half of the present year, is indicated by the following information given out by the food administration:

"According to figures just received the civilian population actually consumed 1,697,235 tons of sugar between Jan. 1 and June 1, 1918.

"This means a civilian per capita consumption of 1 pound 64 ounces weekly, of which 15.7 ounces are estimated purely for domestic or household use. Reducing this consumption to the 12-ounce weekly per capita basis as asked by the food administration before the present 2-pound limit went into effect would reduce 300,000 tons during July to December 31, 1918. The new rationing system will mean the release of nearly 100,000 tons more for that period.

"During the first five months of 1918 the cane sugar production in the country amounted to 1,542,213 tons. The refined sugar production was 1,419,317 tons. The beet sugar sold from the nation's factories during the same period is estimated as 278,857 tons. Some 32,367 tons of sugar without refining passed into consumption during that time, the total amount passing into consumption from these sources amounting to 1,822,231 tons.

"This total, of course, includes only with amounts which went into stocks of wholesalers, jobbers, warehousemen, manufacturers using sugar in large quantities and assumed that a similar amount went from their stocks into direct consumption with the exception of amounts exported, amounts used by the army and navy, and amounts left on hand in stocks of refiners, wholesalers and others on Jan. 1, above what was on hand January 1, 1918.

"About 25,153 tons were exported during the five months period to the allies and neutrals; 66,885 tons were reserved for the army and navy; 233,225 tons were held on hand by refiners, wholesalers and retail dealers, warehouses, confectioners, bakers, milk condimentaries, etc.—on June 1, 1918.

"Subtracting all these amounts from the amounts passing into consumption during the five months period, a total of 1,697,235 tons is the net civilian consumption.

"This means a consumption by citizens of the United States of 78.14 tons a week. Together with the average needs of canning it amounts up to 75 per cent of the normal per year or 15.7 ounces per week as compared with the normal ration of 8 ounces."

NO MAN'S LAND NOYEN TO LOS ANGELES, CALIF.

LOS ANGELES—No Man's Land, that constantly changing terrain between the lines of the allied armies and those of Germany, has been reproduced by nature at Exposition Park and will be the most important part in the allied war exposition, which opens Thursday.

"It looks as if a piece of No Man's Land had been picked up and transported to Exposition Park," said Lieut. R. A. Shaw of the Canadian forces, attached to the administrative headquarters of the exposition yesterday.

"Nowhere in America have I seen a more perfect reproduction of the land that the allied armies have been wrestling from Germany than the little plot in Exposition Park, which will require practically no change to give the people a faithful reproduction of the fighting ground of France."

There never has been any use for the patch of ground, for it has been the one spot that marked the beauty of the big park. That now it will serve the purpose of portraying the vista that greet the eyes of the allied fighters and those of the foe beyond.

In a natural way there is an admirable place for the concealment of the "lady tank" Britannia, so-called because it is the smaller of the two types of tanks used by the British.

Then there is a natural upheaval of earth, which will be a natural protection to the American troops, some 500 men from Camp Kearny arriving here last night to participate in the war game. Across is another upheaval which will protect the "German" troops, attired in German uniforms and fighting in German style.

Communication trenches naturally have to be constructed. There are deep holes which give an excellent impression of having been made by giant shells. The setting is perfect according to Lieutenant Shaw. Yesterday a barrage was laid down as a test.

All over the area set aside for the exposition there is a scene that interests. A broad highway is lined with signs of every description captured from a beaten foe. Some are torn by bullets, others are punctured by shells, all telling a tale of war.

At the head of the highway stands a huge altar above which towers Liberty. To the left a simple shrine with sacred relics consecrated by the House stands as a tribute to France. To the right of Liberty, the Fountain of Victory sparkles.

The fragments of three Zeppelins and five German airplanes, brought down by allied flyers, are on display. One will see the first anti-aircraft gun captured by Pershing's men. Torpedoes and mines are shown. All kinds of trophies of war are on hand, and in the air are shown.

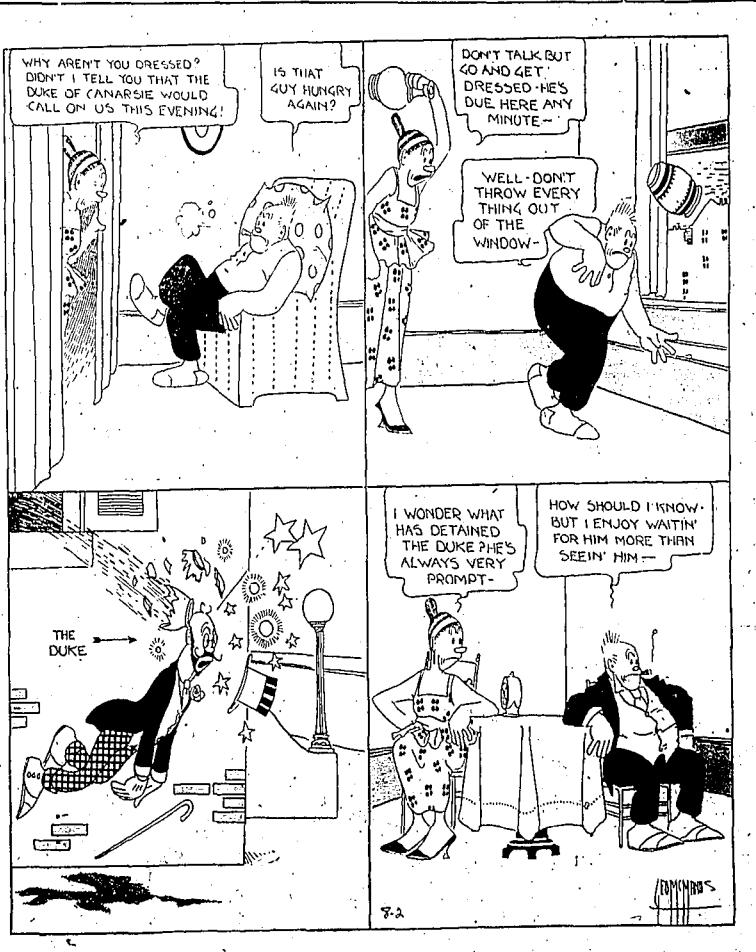

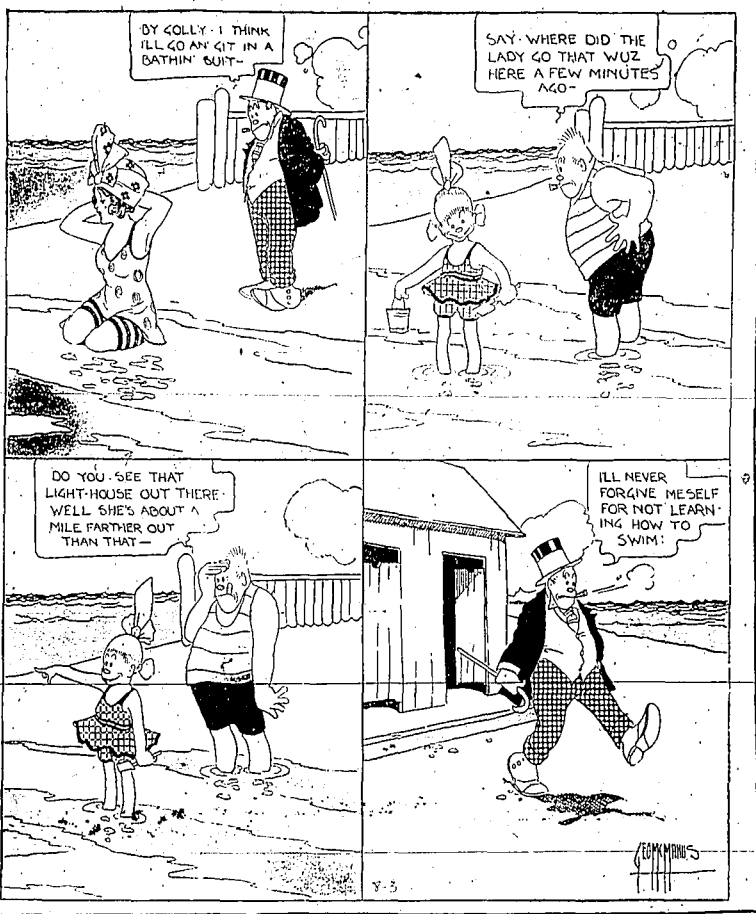

The war department will exhibit models of all the latest guns used by General Pershing's forces. The navy department will show how the Hun is being driven from the sea. The Emergency shipping board will illustrate methods by which America is bridging the Atlantic. The food administration demonstrates work of conservation. The commission on training, camp activities, the Red Cross, the committee on public information, all will have interesting displays.

Anthony A. Tremp, director of exhibits for the United States food administration, arrived in Los Angeles yesterday. He will have charge of sixteen departments showing forms of food conservation. Demonstrations daily will be featured.

MAID-OF-HONOR-IN-CHIEF BESTOWED ON PRETTY GIRL

TULSA, Okla., Aug. 1.—Upon the shoulders of greater eighteen-year-old Juliett Hunt rests the responsibility for the entertainment of the thousands of women who will attend the annual reunion of the Confederate Veterans' Association here in September. Miss Hunt is the first woman of Tulsa to be honored with the appointment of maid-of-honor-in-chief.

Automobiles, Tractors and Good Roads

DO NOT DECREASE AIR PRESSURE IN HOT WEATHER

These hot summer days are the ones that cost motorists a lot of money," is the declaration of G. H. Brunner, manager of the service department, Goodyear Tire & Rubber company, Akron, O.

"Most motorists have a wrong impression about the increase of air pressure in tires in warm weather," says Mr. Brunner. "In fact the belief is quite common that on hot days the pressure must be decreased, and the common

practice is to run tires at a less pressure on warm days. But this increases the bending of the tire carcass and the motorist actually aggravates the tire condition that he seeks to correct. As the pressure in the tire increases it continuously increases slightly, but never sufficiently to cause any injury to the tire. Tires are just as fragile on some persons' names and are able to stand three and four times the ordinary pressure used. There is more chance in decreasing the pressure than in permitting it to increase for after the tires have rested a while the air pressure will drop, and there is always a chance that the motorist will omit to put in enough air to bring the pressure up to the required point.

There is no condition in which tires are subjected to more air pressure variations, than in racing on our speedways. Yet even on the hottest days the terrific hundred mile sprints of the race tracks, with tires revolving 20 times a second, do not cause tires to blow out. And there is certainly no condition in ordinary driving that even approximates those of the speedway. There is no question but that the motorist may greatly benefit by keeping the air pressures, no matter what the best conditions."

PLOWING FIRST WORK FARMER GIVES TRACTOR

Most farmers when buying a tractor purchase it primarily as a plowing power and estimate their tractor needs on the basis of what they require for plowing. A plowing is the fundamental agricultural work that he can, once the type and size of the plowing unit is determined, coordinate with every other type of power machine that is needed upon a farm.

The dealer, therefore, who knows approximately the plowing conditions which are to be met on the given farm, should be the one to advise the farmer intelligently as to the type and size of tractor he should buy. In addition, that dealer is in a position to advise the farmer regarding all other power operative equipment, both from draw-bar and belt, which the farmer wishes to purchase. His work most advantageously, expeditiously and economically. In short, that dealer can co-ordinate power plant and equipment that it will be sure to give the greatest measure of satisfaction.

The dealer who can do this is rendering the farmer the very highest type of service. It is the purpose of this article to put such information into the hands of about 100,000 farmers that he can, once the type and size of the plowing unit is determined, coordinate with every other type of power machine that is needed upon a farm.

In pursuance of this plan the first thing the tractor dealer should consider upon to consider will be the size of the tractor which will be competent to do the plowing upon the farm question. Some of the factors which he must take into consideration already have been noted. These practically determine the character of the soil to be plowed is taken into consideration, the degree of the predominant grades and the number of acres to be plowed. It should be comparatively easy for him to decide whether the tractable soil of the farm should be one which will pull two or three bottom. It is not the purpose of this discussion to consider large farms, but rather confine the subject to the farm of 160 or 240 acres, which will be the range in size which the ordinary tractor dealer will be called upon for the most part to prescribe for.

It is impossible to say, as a general rule, what tractor the dealer should recommend for a farm of a given size because the character of the crops grown, the attitude of the farmer and many other things must determine the choice naturally, will fall between the two and the three-bottom machine and it will happen out that there are other considerations, as belt power requirements, will be the determining factor between the two. As a matter of fact, the fitting of the tractor to the job is something which must be figured out in each individual case, as there is no rule which will apply to all. This much may be concluded, however, that if a proper selection of the plowing power is made, in a vast majority of cases the tractor will have sufficient capacity to handle all the other jobs on the same farm.

In determining whether the particular farmer should have the two or three-bottom plow, the factor which does most concern is the soil conditions. This is due to the fact that various kinds of soil present varying resistance in the passage of the plow bottom. The resistance offered to the bottom in plowing is measured by taking the cross-section of the furrow after it is square inches must multiply this by the resistance per inch offered by the predominating character of the soil on the farm. As an example, the above mentioned case of a furrow of 11 inches in width and 6 inches in depth presents a cross-section of 66 square inches according to the character of the soil which is to be plowed, the resistance at a speed of 2 1/2 miles per hour will vary from 250 pounds to 1250 pounds.

A table of soil resistance, based upon experience in plowing in all sections of the country is 1250 pounds. This, as a table follows.

| | |
|--------------------|------------------------|
| In prairie sod | 15 lb. per sq. in. |
| In sandy soil | 2 to 3 lb. per sq. in. |
| In heavy clay soil | 4 lb. per sq. in. |
| In wheat stubble | 4 lb. per sq. in. |
| In blue grass sod | 6 lb. per sq. in. |
| In June grass sod | 6 lb. per sq. in. |
| In heavy sod | 7 lb. per sq. in. |
| In clay soil | 8 lb. per sq. in. |
| In virgin sod | 20 lb. per sq. in. |

In rando 20 lb. per sq. in. It must be evident that the character of the soil, then, must determine very largely the number of bottom it is possible to pull with a tractor which otherwise will be competent to do all the work necessary on the given farm. Suppose the farm consists of clay soil, the resistance of which is 15 lbs. per sq. in. and which is 100 acres in size. This means the resistance is 672 pounds for one 14-inch bottom, or 1224 pounds for an engine gang of two 14-inch bottoms. As the horsepower rating of a tractor is based upon the draw-bar pull at a speed of 2 1/2 miles per hour, at which speed a pull of 150 pounds is taken to represent one horsepower, the pull of two 14-inch bottoms through clay soil at normal plowing speed would take a tractor rated 8 horsepower at the draw-bar at the very least, or, which is popularly known as an 8-hp tractor, and even this would leave no surplus for the possibility of more difficult soils or grades. The matter of grades is important also. This already has been considered and the rule given is that the weight of tractor and plow which must be moved by the power of the tractor is 1 per cent for each rise of 1 foot in 100 feet of slope. In addition to slay soil there should be grades even of moderate degree, to the two 14-inch bottoms the tractor would have to rate at least 10-20.

From this it will be evident how the dealer in the light of the difficulties it must overcome in accomplishing what the farmer desires it to do. Also in the light of the fact that the farmer realized that there can be no hard and fast rule laid down governing the capacity of tractors, for a tractor which may be able to pull three bottom on one side of a fence may find difficulty in pulling two on the other, or suddenly an area of rough ground change. Very rarely is it found to be the case that a field will show a uniform character of soil and a uniform character of resistance to the plow. This also emphasizes the necessity of selling a tractor with a surplus of power over and above that required for pulling the desired number of bottom through the soil on the particular farm.

COOL ROADS SMOOTHER
AND EASIER ON THE TIRES
LOS ANGELES—Shade trees along California highways are very desirable from the standpoint of the preservation of the tires of the motorist. It is, however, according to the theory advanced by Warren Penn, sales manager of the Maxwell passenger car department of Harold L. Arnold. "Next time you are out driving, note that some of the very smoothest stretches of highway are shaded by trees along the roadside," said Penn last week. "You will notice the

same thing on the stretches of road expected today to be from injuries received when the train struck him. Frank, the five-year-old brother of George, was killed in the negro's arms. He had just saved the smaller boy, and held the older in his arms, ready to toss him to safety when the train struck them.

OLDEST COP RETIRES
NEW YORK, Aug. 2.—Known to every police chief in the United States, Henry Burden, 77, for more than fifty years a policeman, was granted retirement and a pension of \$150 a year today by Commissioner Egan. For the last 20 years Burden has been keeper of the prison at police headquarters, and during that time only one prisoner escaped from his clutches. He has kept hundreds of notorious criminals during his time.
