

THE GREAT STATE IN DRY COLUMN

Senate Approves Measure Making State Dry in 1915

ONLY SIX VOTES OPPOSED WHEN BILL IS PASSED.

Governor M. Alexander Nore to Approve Bill. All Amendments to Bill Fall.

Prohibition legislation is a thing of the past in the state of Idaho. It became so when the senate passed Tuesday, under auspices of the rules, H. B. No. 112, making the state dry by statutory enactment.

There was no doubt that the measure will receive the signature of the governor.

SHERIFF A PROBATION OFFICER

Bill Passes Senate, Now Goes to the Governor.

The act to make sheriffs of this state officio probation officers and which has the opposition of many of the women's clubs and organizations of the province to authorize the state, was passed by the senate this morning under fire of several senators, led by Senator Lavenex Macbeth, who declared passage of such a measure was most reactionary step.

Senators Hart, Whitcomb, Foster, Macbeth, Zuck, Graham and Elliott were of the opinion that the bill would not jeopardize the good work of juvenile courts as they opposed.

DRY BILL REPASSED

Senate Found Bill Was Not Suspended, Had to Do Work Over.

When the senate passed the prohibition bill Tuesday, it was thought that it would be dry in 1916, but it was found that some mistake was made. A telephone message was received Thursday from Representative A. Winters, that the senate had passed the bill Tuesday, but it was not dry until a question.

They're Here Now--- 100 Pretty New Suits 100 Nobby Spring Coats

Never have we shown so many spring garments to choose from. The last few days have added greatly to our stock and never such pretty suits and coats priced so reasonable. The military styles are shown and the flare effects and combinations of Dutch and peasant styles. The lady can choose a garment suitable to her figure that is the latest made. The spring colors and materials are wonderfully pretty. Suits priced \$15.00 and up. Coats

\$7.50 to \$25.00

We Have Learned a Lesson

Some time ago we decided that many people would like to buy here but felt our qualities were higher than they could afford. Not that our prices were higher than others but goods their circumstances would not afford. We debated it. We wanted that business. We decided we would not lower qualities, but make prices as low or lower than asked for other lines. We had good reasons to believe it would double our business. It was not experimental—We Decided. Results are showing us right in our conclusions—therefore look for value giving here.

STAND FOR SAFETY FIRST

Railroads Claim Efficiency of Service of Men Due to Surprise Test.
Chicago, Feb. 20. A firm stand for the surprise test as an essential preparation to insure safe operation of trains was taken by the Conference Committee of Managers of western railroads today before the Federal Board of Arbitration which is hearing the railroads' arguments against the demands of their engineers, and for the advance in wages which would total about \$14,000,000 yearly.
A surprise party was given at the J. J. Prentiss home southwest of town Saturday evening. A jolly crowd of young people were present and all spent a very enjoyable time.
Residents of the Dahl country scarcely realized the beautiful weather

at the railway men, who have come up from the ranks in many cases, said he. "We are sure that the men had some very good things that they had from the neighborhood to the positive. The men are there in a safe for hanging in the night. Some men must know that the man is observing it. \$60 1/2 in a 100 per cent efficiency test by which tests are made upon the rule on whether or not the men are observing them, and we put much on the road to observe."
"After some time it developed that the reports were being made, and after long thought I conceived the idea of having the labor organizations in effect a committee of five men, one from each, while I selected five officials. These men met once a month in my office. They have all the authority I had to examine records and it is their vote which decides a complaint in my case. In one of the 100 per cent efficiency tests, but see how since the board was formed and I have never been called on to vote. I've decided to let them examine the men."
"When 100 tests have been taken of any engineer will not failures the man is given a 100 per cent efficiency certificate, which shows that he has been tried and found there."
"They then turned to the men's demand for maintenance. In this matter I have to examine records and the witness examined the many provisions which have been made to lighten the work of the engineer."

METHODS OF PRUNING THE GRAPE VINES

Forms of Head Pruning—A, spur pruning with high trunk; B, spur pruning with medium trunk; C, head pruning with medium trunk.

Fig. B represents a head, was formed vine with a medium trunk and short fruit spurs. This is the most common system used in all parts of California.

Fig. A differs from B only in the higher trunk and longer arms. It is commonly used for large growing varieties, especially when growing in rich soil and where planted far apart.

Fig. C has the same form of body as A and B, except that the arms are less numerous. It is suited for vigorous table grapes which do not bear well on short spurs. It is a difficult system to keep in good shape owing to the tendency for all the vigor to go to the growth on the ends of the fruit canes.

There is a very large number of systems of pruning applied to the grape vine. These systems differ principally in the form given to the body of the vine, and in the management of the annual growth. Some of the differences depend on variations in the nature of the vine, on the cultural and growing conditions of the district and on the objects of the grower. Others are unessential and are merely a matter of taste. The best system is that which is most adapted to all the conditions of the particular vineyard. Any system which does not take into account the nature of the vine is defective.

Before commencing work the pruner should form a mental picture of an ideal vine of the form desired. Vines are subject to many accidents of weather, cultivation and disease that, even with the greatest care and skill, it may be impossible to obtain a single ideal vine in the vineyard. The ideal vine, however, must exist in the pruner's mind, or all his vines will be unnecessarily defective. With this ideal constantly in mind he is able to take such measures as will, as much as possible, direct the growth of the vine in the right direction and counteract all contrary influences and thus to make each vine approach an nearly as possible the perfect model.

This method is particularly necessary in the treatment of young vines. Only when it is strongly impressed on the imagination is it possible to use such means and measures

valuation is impossible, the arms are given a "fan-shaped" arrangement in a vertical plane.

On the vertical or upright cordon the arms are arranged at a regular intervals as possible on all sides of the trunk from the top to within twelve or fifteen inches of the bottom. On the horizontal cordon the arms are arranged similarly, but as nearly as possible on the upper side of the trunk only.

Each of these systems may again be divided into two subsystems, according to the management of the annual growth or canes. In one, spur pruning, two or three eyes are left for fruit production. This system is called short or spur pruning.

In the other, long canes are left for fruit production. This is called long or cane pruning; in rare cases an intermediate form is adopted in which long spurs or short canes of five or six eyes are left. In some pruning each fruit cane is accompanied by one or two short renewal spurs. These must also accompany half-long pruning. Stages of renewal, where only long canes are left, without renewal spurs, are not in use in California.

In all systems, renewal spurs are left wherever and whenever needed.

Other modifications are introduced by the manner of disposal of the fruit canes. These may be directed vertically, or a stake driven in the foot of each vine or bowed in a circle and tied to the same stake, or they may be tied laterally to wires stretching along the rows in a horizontal, ascending or descending direction.

The principal systems differ therefore in: (1) the shape, length and direction of the trunk; (2) the arrangement of the arms; (3) the use of fruit spurs or fruit canes with renewal spurs; (4) the disposal of the fruit canes.

Forms of Head Pruning—At the left, vertical fruit canes and renewal spurs. Owing to the length of the fruit canes they require support and are tied to a high stake. This system is not to be recommended, as it has many serious defects.

The illustration shows at the right represents an improvement on the other. It differs only in the method of treating the fruit canes. These are bent over in the form of a circle and tied by their middle part to a stake, which may be smaller and lower than that needed for the vertical canes. This bowing of the canes has several useful effects.

As will most rapidly and economically bring the vine to profitable maturity. The systems of pruning in use in California may be divided into two classes according to the arrangement of the arms on the trunk of the vine. In the monostem system there is a definite head to the trunk, from which all the arms arise symmetrically at nearly the same level. The vines of these systems may be called "headed vines" or "the old" systems. The trunk is directed from right to left and the arms are distributed regularly along the whole or the greater portion of its length. The vines of these systems are called "cordons," owing to the regular form of the trunk.

The headed vines are divided according to the length of the vertical trunk into high, 23 feet; medium, 13 feet; and low, 6 feet. The cordon may be vertical or horizontal, according to the direction of the trunk, which is from four to eight feet long. The arrangement of the arms of headed vines may be symmetrical in all directions at an angle of about 45 degrees. Such a vine is said to be "cane trained." This form is used in the great majority of California vineyards and is the most common and cheap system. Where vines are planted in the avenue system, particularly when trellised and where cross cul-

When you buy the new Ford Sedan you buy the Service and Essential Comforts obtained in the high-priced limousine—but you don't pay the extravagant first cost and the excessive maintenance expense. The new Ford Sedan is like the other 675,000 Fords already in use—low in Cost, high in Quality and the most economical car to run that was ever built—on the average of less than two cents per mile.

Ford Sedan, \$975; Coupelet \$750; Town Car \$690; Touring Car \$490; Runabout \$440. All fully equipped. L. o. b. Detroit.

On sale at the

WESTERN AUTO CO.

Buyers will share in profits if we sell at retail 300,000 new Ford cars between August, 1914 and August 1915.

METHOD FOR DOCKING LAMBS

Operation Should Be Performed When Youngsters Are About Ten Days Old—Short Tail Desired.

Docking should be done when the lambs are about ten days old. The easiest method is to place the lamb between the operator's legs, its head in front of him. The operator lifts the tail and with a heavy knife pushes the skin half way on the under side of the third vertebra to his junction with the second. Then with a sharp cut he covers the tail at this point. Many shepherds leave the tail one vertebra longer, but a short tail is greatly to be desired since it can not collect so much manure.

Very seldom, if the lamb is docked early, will there be sufficient bleeding to cause any material harm. If profuse bleeding does occur, a cord should be tied very tightly around the stem of the tail. Pieces heated to a high temperature, may also be used for this purpose, and by many are preferred. The tail is severed by closing them upon it. The clamp is removed or burned, which completely prevents bleeding. However, a burn will not heal so quickly as a clean cut, and in the former condition suppuration or the formation of pus underneath the scab may occur.

Of course, there is a greater liability of dangerous infection where the knife, without cauterization, is used. However, the sealed surface tends to prevent the entrance of bacteria infection, however, can be avoided by the maintenance of cleanly and sanitary surroundings. The placenta can satisfactorily be adopted for docking lambs several weeks old, when the continuing of bleeding is more likely.

MAKE PROFITS WITH STEERS

Animals Must Have Good Beef Characteristics, a Wide, Strong Back, and a Large Heart Girth.

How to select steers that will make good gains and return substantial profits should be well known by the stock raiser who plans to market his crops as feed for his own or other stock.

The work has been done in California, knowledge successfully in California. When steers have been studied, the ground surface must be covered at once, before the wind and sun have access to the wound. The injured parts may be painted or covered with grating wax.

An rule, never treated in this manner, in the spring will grow new bark. In cases of severe girdling, the method of surface grating may be used, this operation being a single one for a surgeon familiar with the process of grating.

The following method of poisoning was used successfully in an orchard near Fort Collins last winter. 50 jack rabbits being killed in one night.

Cut a slit in an apple and insert strychnine alkaloid, powdered, the right amount being what the tip of a knife blade will hold, close the slit and wipe the apple to remove the bitter drug on the outside—scatter the poisoned bait through the orchard at the base of the trees.

Cockerels Are a Nuisance.

It never pays to winter a large number of immature cockerels. They are a nuisance in the hen house in the winter and will "eat their heads off."

GREATEST THING IS LIBERTY

Nothing That Man Is Capable of Achieving Can Ever Take Its Place.

In one of the most passages in "Les Miserables," Marius, the young anarchist who has become converted to what he thinks are liberal ideas, is upbraiding Napoleon. He rebukes the Cockerels' wonderful genius and unparalleled achievements, points out the "age" which he brought to France, and says dramatically what would be the motto of the human race. A quiet youth of the little revolutionary group raises his head and answers: "To be free!"

It is well to recall this remark now, as the "age" of "whether" is usurping the place of the law and the people.

Liberty is a fine thing, in public matters as well as in private ones. It is better to be free than to be efficient, better to be free than to be rich, better to be free than to be a millionaire. Liberty alone remains of permanent value.—Chicago Journal.

We pay no attention to bookers. Our work books for itself. Farrot Optical Co.—Adv.

A repetition of your name and even a dozen publications of it—would be a really inexpensive way of selling that property!
